<thead>
<tr>
<th>Internship description (max. 15 lines)</th>
<th>The solidification of alloys can produce a huge variety of complex microstructures, such as dendrites (tree-like structures, similar to snowflakes), lamellar or fibrous composites, or polycrystalline grain structures. The phase-field method has emerged in recent years as a comprehensive tool for the modelling and simulation of such structures. This method uses phenomenological equations of out-of-equilibrium thermodynamics, a system of coupled nonlinear partial differential equations that can be integrated in time using standard numerical methods. In this internship, the student will learn the fundamentals of this method and use or modify existing codes to explore aspects of pattern formation in solidification or fluid mechanics.</th>
